01. FLOW OF PROGRAM

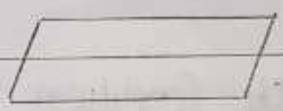

* Flow chart : Visualization of our process or Algorithem and represents them diagrammatically is called flow chart.

* Symbole to Be Used in flow chart.

01. Start / Stop →

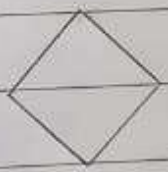

02. Input / output →

03. Processing →

04. Condition →

05. Flow direction of Program →

01. Start / Stop : An ovel shape indicate the starting and ending point of the flow chart.

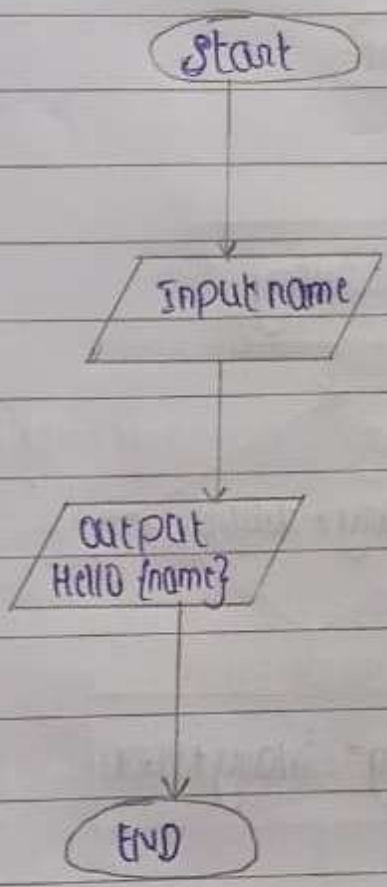

02. Input / output : A parallelogram is used to represent input and output in flow chart.

03. Processing : A rectangle is used to represent process such as mathematical computation an variable statement assignment.

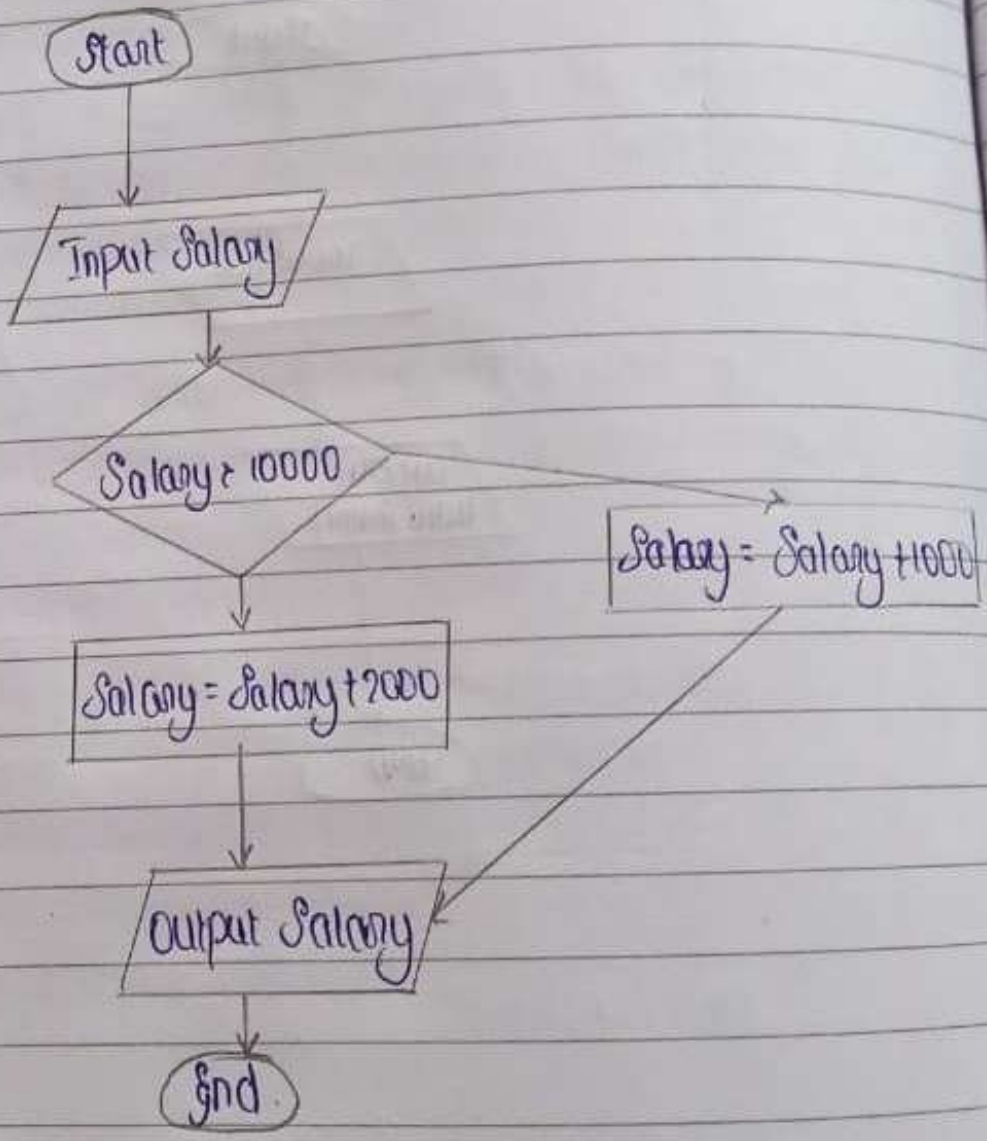

04. Condition : A diamond shape is used to represent Conditional Statement which results in true or false (YES / NO).

05. Flow direction of program : An arrow shape is used to represent flow of the program.

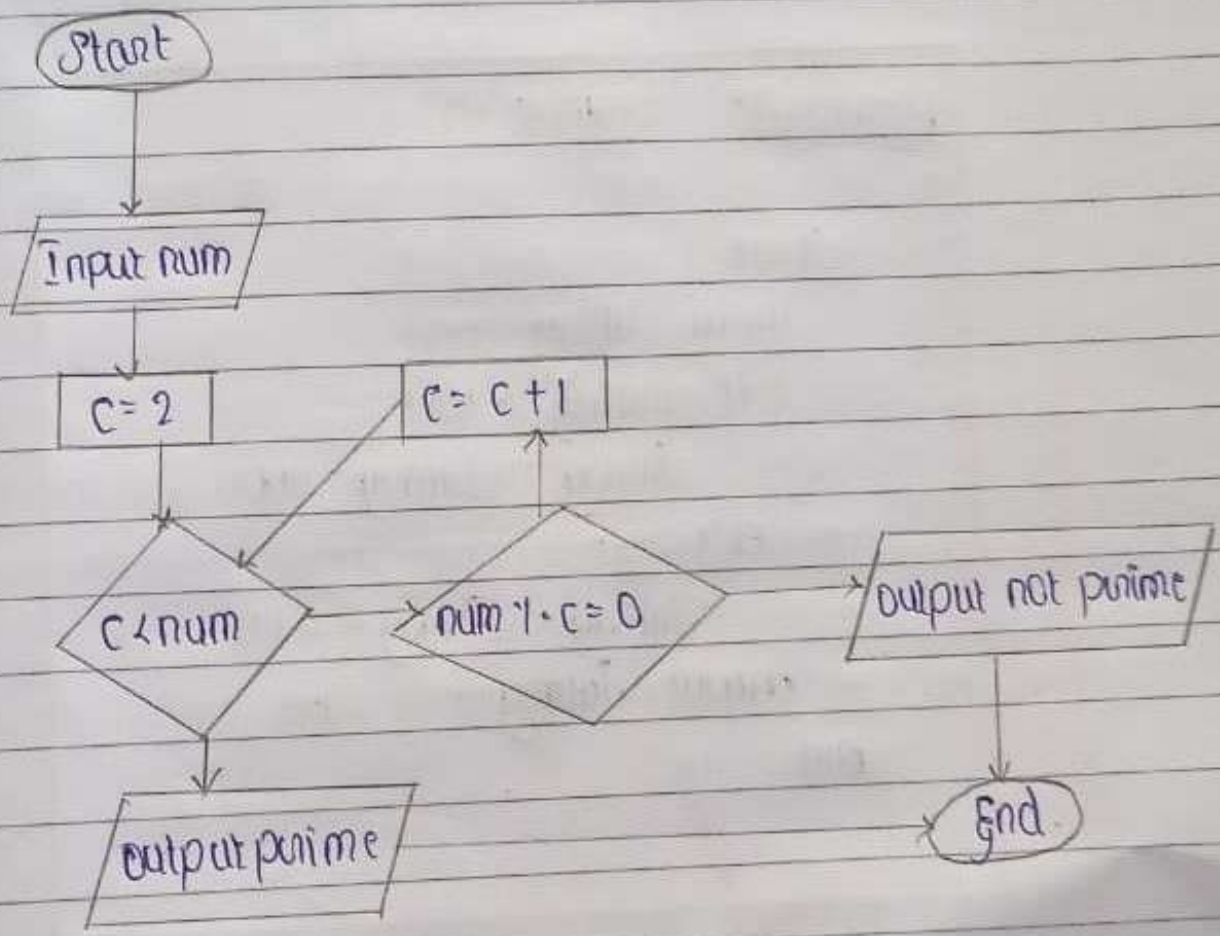

* Example 01. Take a ~~dividend~~ name and output Hello name.

Example 02. Take input of a Salary. If the Salary is greater than 10,000 add bonus of 2000, otherwise add bonus of 1000.

*. Example 03. Input a number and print weather it is prime or not.

Pseudocode

* It is like a rough code which represents how the algorithem works before code runs.

* Pseudocode does not require any syntax.

Pseudocode example 01.

```
Start
  Input Salary
    if Salary < 1000:
       Salary = Salary + 2000
    else:
       Salary = Salary + 1000
  output Salary
end.
```

Pseudocode Example 02

```
Start
  Input num
    if num <= 1
      Print ("Neither Prime nor Composite")
    C = 2
    while (c < num)
      if (num % C == 0
        output ("Not Prime")
        Exit
      C = C+1
    end while
    output ("Prime")
Exit.
```
